

# The Great Barrier Reef

Pictures by Tylar Morano

Tylar snorkeling just above the reef.

This is a parrot fish. Below is the living coral!

Here is some more living coral. It's hard and sharp.

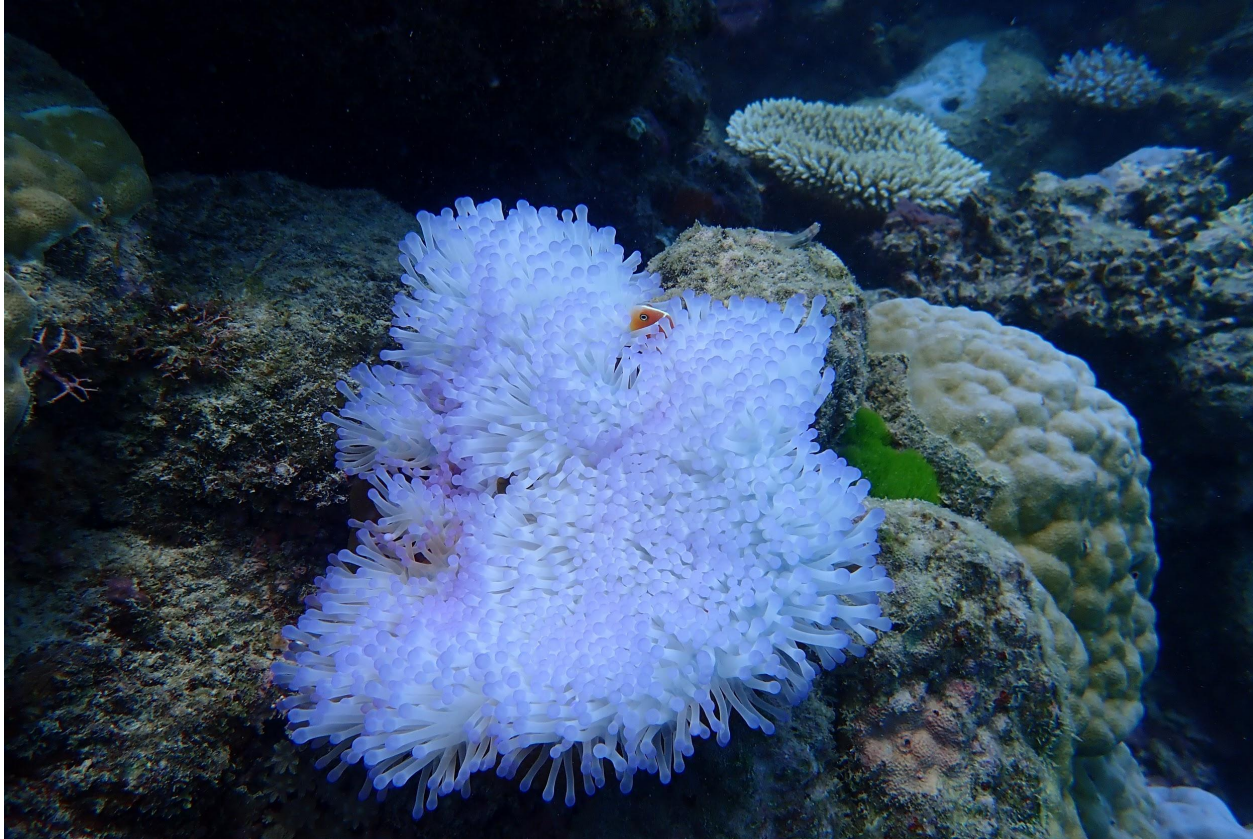

Parrot fish eat coral and poop out sand!

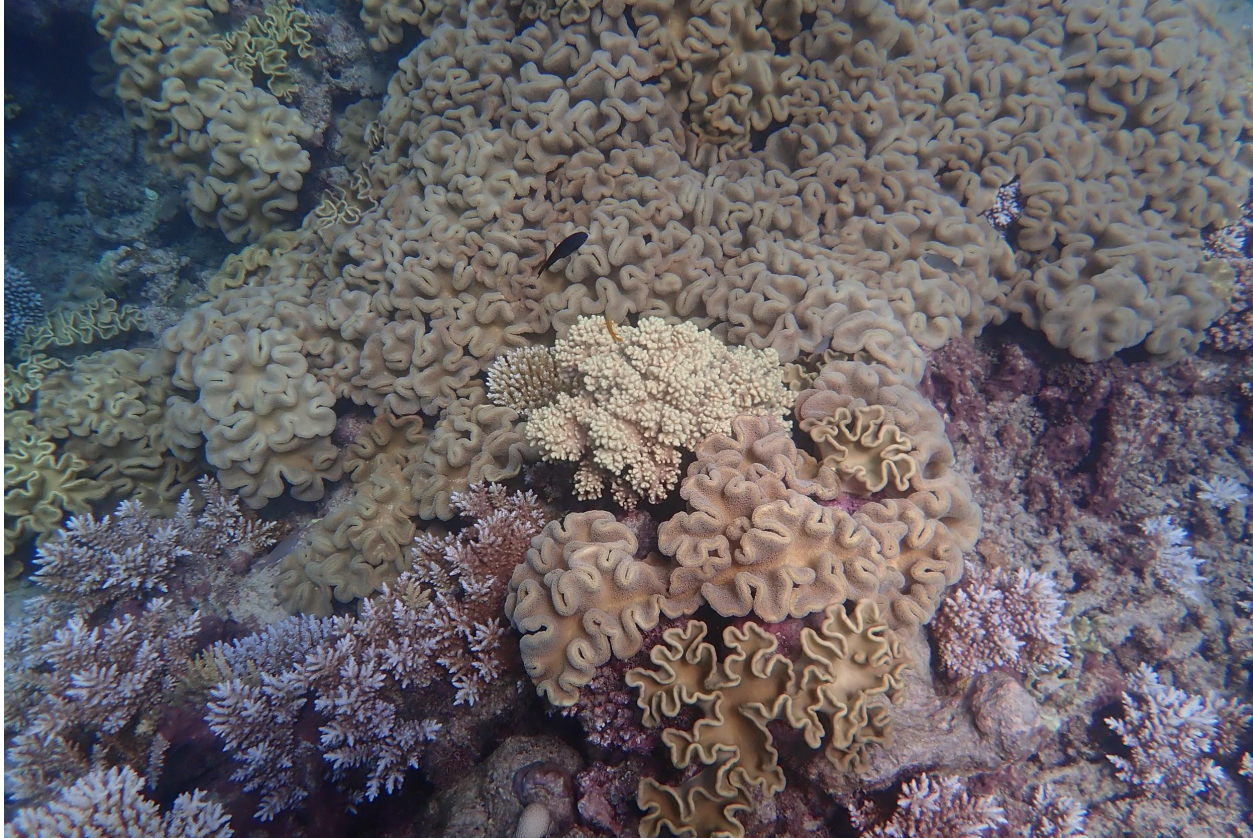

This clownfish (Nemo) is hiding in a sea anemone.

Brain coral looks like a brain. This is brain coral.

More brain coral and a swimming parrot fish.

More coral, and can you spot the camouflaged fish?

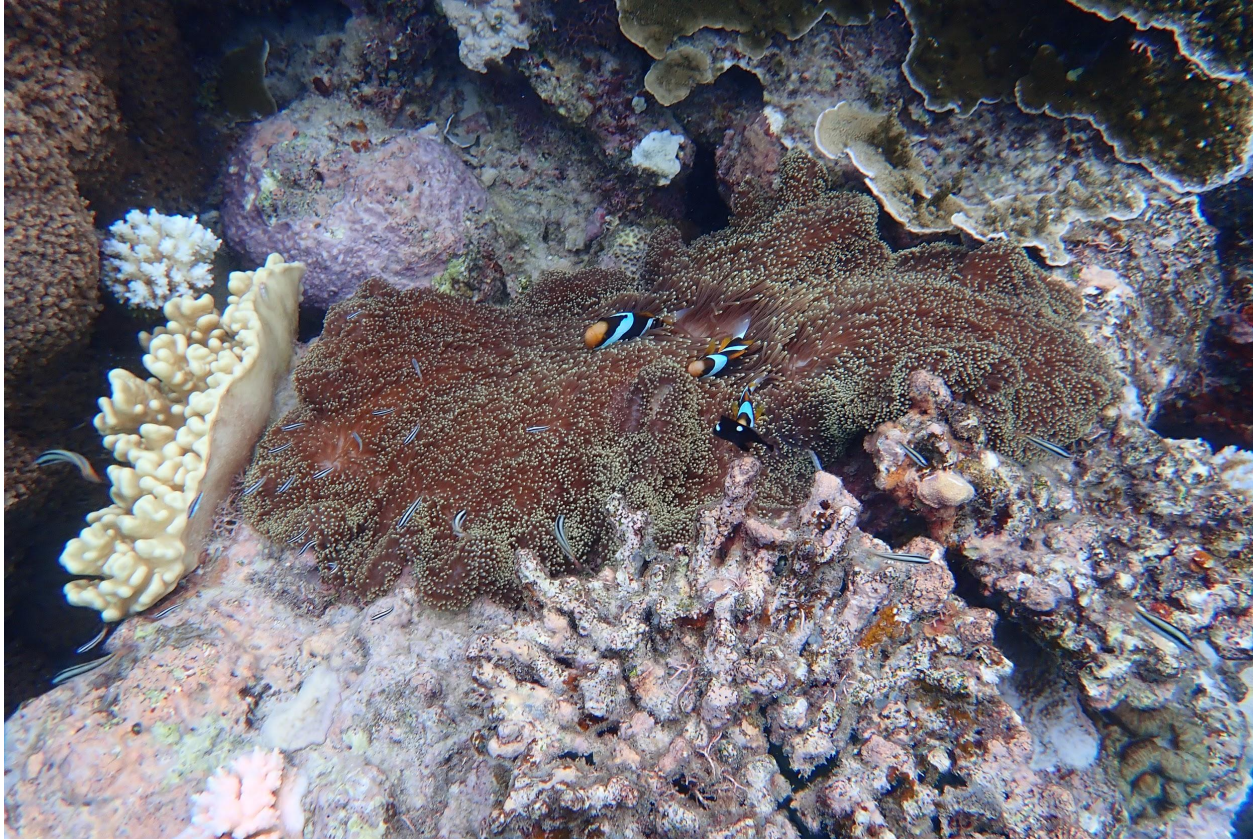

Coral reefs are not flat. They are rugged and steep.

In this picture, you see clown fish that are a different kind.

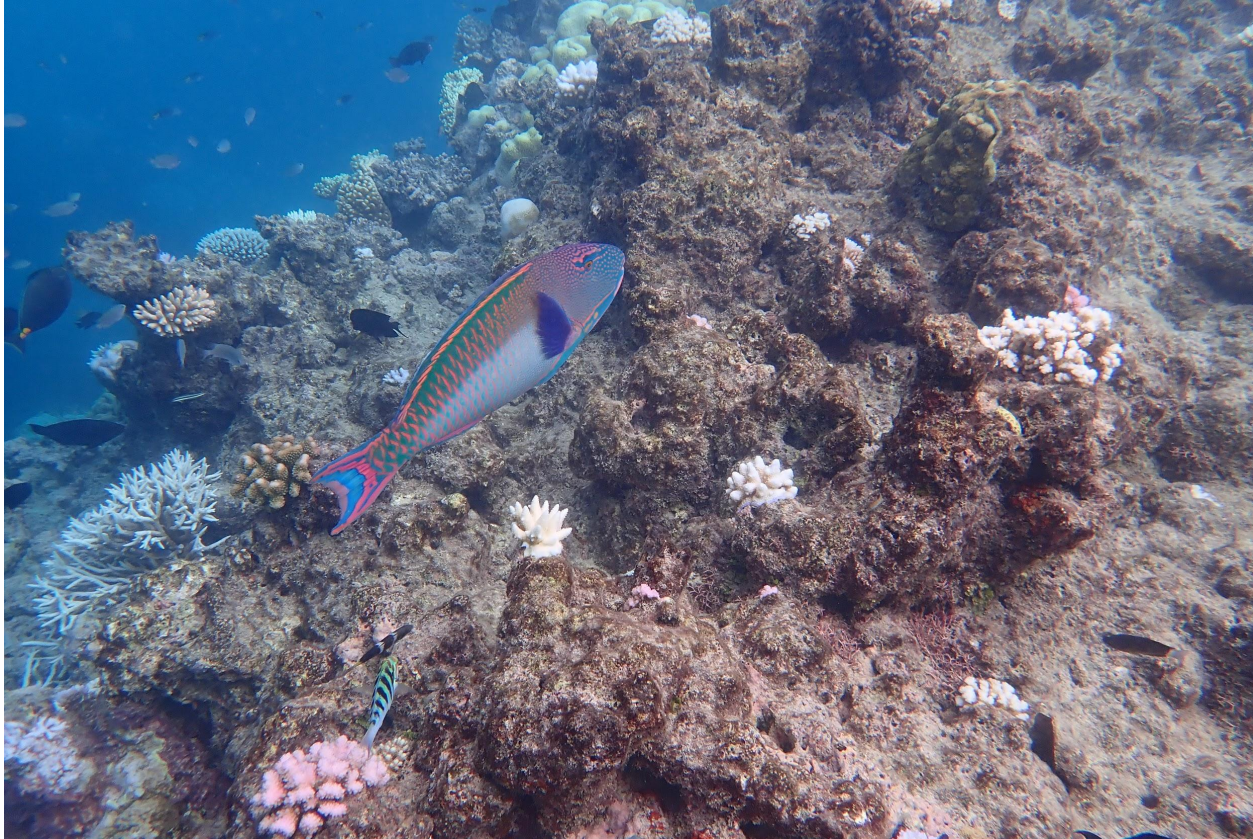

What a magnificent picture of the reef, in my opinion!

This is Tylar's favorite picture of a parrot fish.

Two fish feasting on some coral.

I see a camouflaged fish on top of a coral. Do you?

Tylar is going deeper for a closer look.

Good-bye everyone from the Great Barrier Reef!
